Table of Contents

Practitioner's Report	3
This report highlights the notes made about the results of this blood test.	
Blood Test Results Report	4
This report lists the blood test results and shows whether or not an individual biomarker is outside of the optimal range and/or outside of the clinical lab range.	
Blood Test Results Comparative Report	9
This report lists the blood test results and shows whether or not an individual biomarker is outside of the optimal range and/or outside of the clinical lab range.	
% Deviation from Optimal Report	11
This report shows the biomarkers on this blood test that are farthest from optimal expressed as a % deviation from the median.	
Out Of Optimal Range Report	13
This report will give you background details about the biomarkers on this blood test that are outside the optimal range high and low.	
Functional Index Report	15
This report presents the 20 Indices of Functional Health.	
Nutrient Index Report	17
This report presents the 6 Indices of Nutrient Health and areas of nutrient need.	
Blood Test History Report	19
An historical view of the chosen blood test and up to 6 ealier ones side by side highlighting biomarkers that are outside the optimal ranges.

Knox's Notes

Blood Test Results Report

The Blood Test Results Summary Report lists the results of the patient's Chemistry Screen and CBC and shows you whether or not an individual biomarker is outside of the optimal range and/or outside of the clinical lab range. The biomarkers appear in the order in which they appear on the lab test form.

Out of Optimal Range Report

The following results show all of the biomarkers that are out of the optimal reference range. The biomarkers that appear closest to the top of each section are those biomarkers that are farthest from optimal.

Above Optimal Range 3 Current 	Above Standard Range 3 Current 	Alarm High 0 Current 
Below Optimal Range 0 Current 	Below Standard Range 0 Current 	Alarm Low 0 Current 

Above Optimal

HDL Cholesterol 120.00 mg/dL (+ 383 %)

HDL functions to transport cholesterol from the peripheral tissues and vessel walls to the liver for processing and metabolism into bile salts. It is known as “good cholesterol” because it is thought that this process of bringing cholesterol from the peripheral tissue to the liver is protective against atherosclerosis. Increased HDL is considered protective for the formation of fatty plaques in the artery.

C-Reactive Protein 1.50 mg/dl (+ 283 %)

C-Reactive Protein is a blood marker that can help indicate the level of inflammation in the body.

Cholesterol - Total 225.00 mg/dL (+ 275 %)

Cholesterol is a steroid found in every cell of the body and in the plasma. It is an essential component in the structure of the cell membrane where it controls membrane fluidity. It provides the structural backbone for every steroid hormone in the body, which includes adrenal and sex hormones and vitamin D. The myelin sheaths of nerve fibers are derived from cholesterol and the bile salts that emulsify fats are composed of cholesterol. Cholesterol is made in the body by the liver and other organs, and from dietary sources. The liver, the intestines, and the skin produce between 60-80% of the body’s cholesterol. The remainder comes from the diet. An increased cholesterol is just one of many independent risk factors for cardiovascular disease. It is also associated with metabolic syndrome, hypothyroidism, biliary stasis, and fatty liver.

Glucose 90.00 mg/dL (+ 86 %)

Blood glucose levels are regulated by several important hormones including insulin and glucagon. Glucose is also directly formed in the body from carbohydrate digestion and from the conversion in the liver of other sugars, such as fructose, into glucose. Increased blood glucose is associated with type 1 & 2 diabetes, metabolic syndrome, and insulin resistance.

TSH ↑ 3.20 μU/mL (+ 62 %)

TSH or thyroid stimulating hormone is a hormone produced by the anterior pituitary to control the thyroid gland's production of T4, to store T4 and to release it into the bloodstream. TSH synthesis and secretion is regulated by the release of TRH (Thyroid Releasing Hormone) from the hypothalamus. TSH levels describe the body's desire for more thyroid hormone (T4 or T3), which is done in relation to the body's need for energy. A high TSH is the body's way of saying "we need more thyroid hormone". Optimal TSH levels, in a normally functioning pituitary, can tell us that the amount of T4 in the blood match the body's current need and/or ability to utilize the energy necessary for optimal cell function. When the pituitary is not functioning in an optimal manner, the TSH test can be quite misleading.

LDL Cholesterol ↑ 125.00 mg/dL (+ 54 %)

LDL functions to transport cholesterol and other fatty acids from the liver to the peripheral tissues for uptake and metabolism by the cells. It is known as "bad cholesterol" because it is thought that this process of bringing cholesterol from the liver to the peripheral tissue increases the risk for atherosclerosis. An increased LDL cholesterol is just one of many independent risk factors for cardiovascular disease. It is also associated with metabolic syndrome, oxidative stress and fatty liver.

Functional Index Report

The indices shown below represent an analysis of your blood test results. These results have been converted into your individual Functional Indices Report based on our latest research. This report gives me an indication of the level of dysfunction that exists in the various physiological systems in your body from the digestion of the food you eat to the health of your liver and the strength of your immune system – which are all key factors in maintaining optimal health. We can use this information to put together a unique treatment plan designed to bring your body back into a state of functional health, wellness and energy.

Thyroid Function Index

The Thyroid Function Index allows us to assess the functional health of your thyroid. The thyroid produces hormones that control how the body uses energy. They are responsible for controlling metabolism in the body, for maintaining body temperature, regulating cholesterol and controlling mood. By examining specific elements on the blood test we can see if your thyroid is in a state of increased function (a condition called hyperthyroidism), in a state of decreased function (hypothyroidism) or hopefully optimal function! For your blood test, your Thyroid Function Index is:

[83%] - Dysfunction Likely. Improvement required.

Rationale:

TSH ↑

Blood Sugar Index

The Blood Sugar index tells us how well your body is regulating blood glucose. Blood sugar dysregulation is very common. It doesn't suddenly emerge but rather develops slowly, so we can look for clues in your blood test that can help us determine if there's dysregulation and if so what it is. Some conditions associated with blood sugar dysregulation include hypoglycemia (periods of low blood sugar), metabolic syndrome, hyperinsulinemia and diabetes. For your blood test, your Blood Sugar Index is:

[73%] - Dysfunction Likely. Improvement required.

Rationale:

Glucose ↑, Cholesterol - Total ↑, LDL Cholesterol ↑

Lipid Panel Index

The Lipid Panel index gives us an indication of the levels of cholesterol and fat in your blood. An increased Lipid Panel Index indicates that you have higher than optimal levels of cholesterol and fat in your blood (a condition called hyperlipidemia). Hyperlipidemia is associated with an increased risk of cardiovascular disease and may be genetic or be due to dietary factors, hormonal imbalances, blood sugar dysregulation and/or other metabolic imbalances. For your blood test, your Lipid Panel Index is:

[55%] - Dysfunction Possible. There may be improvement needed in certain areas.

Rationale:

Cholesterol - Total ↑, LDL Cholesterol ↑

Nutrient Index Report

The indices shown below represent an analysis of your blood test results. These results have been converted into your individual Nutrient Assessment Report based on our latest research. This report gives me an indication of your nutritional status. Nutritional status is influenced by actual dietary intake, digestion, absorption, assimilation and cellular uptake of the nutrients themselves. We can use this information to put together a unique treatment plan designed to bring your body back into a state of functional health, wellness and energy.

Nutrient Index Status	Optimum < 50%	Moderate 50% - 70%	Low 70% - 90%	Poor > 90%
Carbohydrate Index		50%		
Protein Index	11%			
Hydration Index	0%			
Fat Index	0%			
Vitamin Index	0%			
Mineral Index	0%			

Carbohydrate Index

The Carbohydrate Index gives us an assessment of your dietary intake of carbohydrates, especially refined carbohydrates (white flour, white rice, white pasta, etc.) and sugars. A diet high in refined carbohydrates and sugars will deplete important nutrients that are used by the body to handle carbohydrates and may also increase blood glucose and blood fat levels, all of which can be measured in your blood. For your blood test, your Carbohydrate Index is:

[50%] - Moderate Nutrient Status. There may be improvement needed in certain areas.

Rationale:

Glucose ↑, Cholesterol - Total ↑, LDL Cholesterol ↑

Individual Nutrient Values

The values below represent the degree of deficiency for individual nutrients based on your blood results. The status of an individual nutrient is based on a number of factors such as actual dietary intake, digestion, absorption, assimilation and cellular uptake of the nutrients themselves. All of these factors must be taken into consideration before determining whether or not you actually need an individual nutrient. I will use the information in this section of your Nutrient Assessment Report to put together an individualized treatment plan to bring your body back into a state of optimal nutritional function.

Deficiency	Less Likely < 50%	Possible 50% - 70%	Likely 70% - 90%	Highly Likely > 90%
Thiamine Need	10%			
Iodine Need	9%			
Vitamin B6 Need	0%			
Iron Deficiency	0%			

Deficiency	Less Likely < 50%	Possible 50% - 70%	Likely 70% - 90%	Highly Likely > 90%
Zinc Need	0%			
Magnesium Need	0%			
Vitamin B12/Folate Need	0%			
Calcium Need	0%			
DHEA Need	0%			
Vitamin C Need	0%			
Molybdenum Need	0%			
Selenium Need	0%			
Glutathione Need	0%			

Blood Test History Report

The Blood Test History Report lists the results of your Blood Chemistry Screen and CBC tests side by side with the latest test listed on the right hand side. This report allows you to compare results over time and see where improvement has been made and allows you to track your progress.
